

GCCS Global council of geopolitical stability

Opinion article about cybersecurity and cyber-attacks between countries:

Today, countries are not only fighting with weapons, but also with technology. Cyber attacks are becoming more common, where hackers try to break into important systems like banks, hospitals, and governments. This is very dangerous because it can affect many people without them even knowing what is happening.

Many governments use cyber attacks to weaken other countries, but they do not always admit it. This makes the situation more complicated, because it is hard to know who is responsible. It is like a hidden war that happens in secret.

Even though there are no bombs or soldiers, the damage can still be very serious. For example, if a hospital system is attacked, people might not receive medical care. If banks are attacked, people could lose their money. This shows that cyber attacks can hurt everyday life.

Another problem is that there are not enough global rules to control this kind of conflict. Countries act on their own, and there is little cooperation to stop these attacks. This creates insecurity and mistrust between nations.

In conclusion, cyber attacks are a new form of war that threatens global stability. The world needs stronger rules and better cooperation to prevent these attacks. The real question is: how can we stop a war that we cannot even see?
